

HTML and CSS Homework

Create a travelling blog page using HTML and CSS. Following the Design Specifications listed below.

Important! You must use either FlexBox Design, CSS Grid, or Bootstrap to customize the page.

Design Specifications

Create the following HTML pages. Implement the following specifications:

- Create HTML and CSS files
- Link CSS and fonts files
- Add default text styles
- Container
- Navigation
- +Add article Button
- Article
 - Article title
 - Article info
 - Article edit delete buttons
 - Article image
 - Article content
- Footer
- Modal

Articles Page

Follow the rules defined in the *articles.jpg* picture. Please note that there are many spacings and paddings defined. You may use your own custom images and your own texts.

Modal

Implement a modal (an intra page “pop-up”). You will learn later (at JavaScript courses) how to trigger its open/close actions. For now, just implement a div somewhere in the page and make it a modal.

Hint: Look for `z-index` CSS property, which allows setting the position on the Z scale for every element, thus you can “stack” elements one over another one. Please also remember to use `position: absolute` to position the modal. <https://css-tricks.com/almanac/properties/z/z-index/>

Styles

Follow the rules define in the *custom.jpg* picture. Please note that there are many spacings and paddings defined. You may use your own colors and your own texts.
